TRACKVIA

Keep campus operations running. Make every dollar and every person count.

Aging buildings, growing maintenance needs, and tight budgets put pressure on colleges and universities. Facilities teams must keep campuses safe and responsive with limited staff and funding.

When work orders, inspections, asset records, and approvals live in paper, spreadsheets, and disconnected systems, small problems become expensive delays. TrackVia connects campus teams and existing systems so work moves faster and leaders can see what needs attention.

Connect the work. Control the operation.

THE PROVEN BENEFITS OF TRACKVIA

Weeks to hours

Work orders and handoffs: Engineering services provider Downer reported reducing delays from weeks to hours with connected field workflows.

80% time savings

Inspections and reporting: LifeCenter and Lifeline of Ohio reported 80% time savings in quality tracking and reporting workflows.

5.9M records tracked

Asset and operational records: A large public university uses six TrackVia applications for inventory, logistics, service requests, and surplus operations.

Purpose-built for campus operations. Adaptable to your institution.

Every college and university has its own mix of buildings, departments, equipment, and operational challenges. TrackVia gives facilities teams a flexible way to manage work across campus while connecting the systems they already rely on. Start with maintenance requests, inspections, or asset management, then expand as needs change. Staff can capture information on mobile devices, automatically assign work based on inspection findings, and track progress through completion. Managers get a clear view of what is happening across buildings and departments.

5 ways to keep campus operations running with fewer resources

1 Maintenance requests get lost between buildings and departments

Repair requests arrive from residence halls, classrooms, and campus offices through email, calls, and spreadsheets. Managers chase updates while crews lose time on handoffs and unclear priorities.

TrackVia captures maintenance requests in one place, automatically assigns work to the right people or teams, and tracks progress through completion. Staff can update work orders, add photos, and document repairs from mobile devices. Managers can see what is open, overdue, or complete without chasing updates across campus.

2 Building problems go unnoticed until they become expensive

Paper inspections and scattered records make it hard to spot recurring issues or confirm that a finding was fixed. A small problem can sit unresolved across multiple buildings.

TrackVia makes it easy to complete inspections, capture photos, and document findings in the field. When a safety or compliance check fails, TrackVia can automatically create and assign corrective work or projects. Track each issue from the initial finding through resolution, with a record of who responded and when.

3 Nobody has a complete picture of campus assets

Equipment, furniture, and supplies move across departments throughout their useful lives. Separate records for inventory, transfers, and surplus disposition make it harder to know what is available and where it belongs.

TrackVia connects asset records, inventory, departmental transfers, and end-of-life disposition in one system. Teams can track equipment locations, ownership changes, service histories, and surplus processes without disconnected spreadsheets. Make better decisions about what to maintain, move, reuse, or replace.

4 Preventive maintenance gets pushed aside by urgent repairs

Urgent requests take priority when crews are stretched thin. Schedules, equipment histories, and inspection findings stored in separate places make planned work easier to miss.

TrackVia connects recurring maintenance schedules, equipment records, and work assignments so important tasks do not get overlooked. Automatically create and assign work based on schedules, equipment conditions, or inspection findings. See upcoming, overdue, and completed maintenance across campus to help prioritize limited resources.

5 Campus leaders can't see where time and money are going

Facilities information is spread across buildings, departments, and systems. Leaders spend too much time gathering updates and have little visibility into delays, workloads, and resource needs.

TrackVia brings work orders, inspections, asset information, and departmental activity into one current operating view. Dashboards help leaders monitor open work, identify recurring issues, and understand where resources are stretched. Connections to existing campus systems reduce manual reporting and support better decisions about maintenance and staffing.

Campus operations cannot afford to fall behind.

Higher education teams are expected to maintain aging facilities and deliver reliable services while controlling costs. TrackVia connects work orders, inspections, asset management, and campus operations so staff spend less time chasing information and more time keeping campus running.

Purpose-built for the work. Connected as it happens. Adaptable as operations change.

Connect the work. Control the operation.

See how TrackVia can help your facilities team manage work orders, automate inspection follow-up, and get more from your campus resources.
